

Status that writes itself — you approve before anyone sees it.

Permissioned engineering context · Meeting elimination · Design partner leave-behind

What you get

Connect **GitHub** (work) + **Slack or Teams** (delivery). We build a permissioned graph of people, PRs, commits, and intents. Rare private status digests — **Approve / Edit / Don't send** — not spam on every webhook.

What we never do

- Glean-style search crawl of your company · • LOC / individual productivity rankings · • Silent private 1:1 chat wiretap · • Bot tokens loose in app env

How a 10-person eng team uses it

Role	Surface	What they do
ICs (mapped)	Private chat digest	Review draft · Approve / Edit / Don't send
Champion	Web cockpit + digests	Pod pulse · conflicts · heat · map people · compile
Unmapped	—	No digests until you add them (no spam)

Pilot path (today)

White-glove install (~45–90 min): GitHub App + chat bot + map ≥ 2 people. Staging reference: <https://status.neel.world/app/> → **Cockpit**. Start with 2 humans; expand to the pod when digests are trusted.

Product path (roadmap)

Connect Slack or Teams · Connect GitHub · optional Google/SSO · employee invite map · Microsoft Teams adapter (same Approve loop). Architecture is chat-adapter based; more channels later after Slack+Teams prove value.

Two-week success

≥ 2 mapped digests when work changes · blocker/conflict visible when real · Approve/Edit/Don't send used once · optionally cancel one standup · suppressions ■ spam.

“Two weeks of shadow digests. Cancel one standup if Don't-send stays healthy. We never silent-read private 1:1s.”

Next step: 45–90 min install call · map your eng pod · shadow digests · kill a standup.
