

UX Brief — Sales Call

Current-truth pilot experience · Staging: status.neel.world/app/

Pitch: Status that writes itself from your PRs and pushes — you approve before anyone sees it.

1. What this product is

AI Manager is a **permissioned engineering context plane** plus **meeting elimination**. Success metric: meetings deleted, not messages sent.

We do	We are not
Ingest GitHub work under ACL; map people ↔ work ↔ intents	Glean-style company search
Rare private status digests in chat	Buzz workspace / chat OS
Approve / Edit / Don't send human gate	Centaur agent OS / silent 1:1 wiretap
Kill standups with trusted signal	LOC or productivity rankings

2. How a ~10-person team gets on (today)

Honest pilot model: white-glove install + chat-first for ICs. No “each employee creates a website password” flow yet. People already live in GitHub and Slack (or Teams on the roadmap).

Who	How they join	Primary surface
Champion	Mapped + pilot URL	Web app /app/
Mapped ICs (start 2 → 10)	GitHub work + chat user id	Private digests in chat
Unmapped	Nothing yet	No digests (by design)
Vendor (you)	Install runbook	Setup & health

DNS / multi-customer

- Pilot: shared host (status.neel.world) or one dedicated instance.
- Not yet: self-serve acme.ai-manager.com signup.
- Custom domain is packaging later — value is digests + graph.

3. Employee experience

When the story of their work **changes** (Notify Policy v1 — change-only + daily cap), they get a **private** draft with evidence-backed bullets.

Action	Meaning
Approve	Accurate — share / publish path OK
Edit	Fix the words first
Don't send	Kill this draft; never post

They do not get: others' digests as surveillance, LOC boards, ping on every webhook, bot reading private human↔human DMs.

"It already knows my open work. I'm not typing standup bullets."

4. Champion / management experience

Screen	Use on the call
Today	Readiness, digests board, blockers/conflicts
Team	Map people, compile digests
My status	Real draft → Approve / Edit / Don't send
Graph	People → work → intents (SHIP / FREEZE / BLOCKED)
Settings	Anti-spam: suppressions ■ sends

5. Five-minute live demo

- Open <https://status.neel.world/app/> (hard refresh if needed).
- Today → click a person under digests.
- My status → real draft; name Approve / Don't send.
- Graph → people, PR, intents (Hide demo on).
- Settings → notify policy; suppressed ■ sent.

Avoid: Lab console, alice/bob as "real team," promising Linear search, promising live Teams if not built.

6. Hard questions

Question	Answer
How do people log in?	ICs are chat-first. Web is champion cockpit. Self-serve seats = roadmap.
Separate DNS?	Pilot host or dedicated instance; custom domain later.
We use Teams	Same loop; Teams delivery on roadmap (doc 03). Don't over-demo.
Who sees my status?	You first, privately. Team after Approve/publish.
Manager spy?	Work context + conflicts — not LOC rankings.
How many day one?	Map 2 first; expand to eng pod when trusted.

7. Two-week success

- ≥2 humans mapped with real digests when work changes
- Blocker/conflict visible when it exists
- Someone used Approve / Edit / Don't send
- Optionally one standup canceled

"Two weeks of shadow digests. Cancel one standup if Don't-send stays healthy. We never silent-read private 1:1s."

8. Close

You don't put ten people on a new website account. You connect GitHub and their chat once, map the eng pod, and people keep working where they already are. When the story changes, each mapped engineer gets a private draft they control—and the champion uses the web app for digests, conflicts, and the graph so the standup can die.
