

Ideal 10-Person UX Vision

North-star journey · polished for sales storytelling

Pitch: Status that writes itself from your PRs and pushes — you approve before anyone sees it.

1. Vision in one screen

- Join via company identity (optional Google/SSO).
- Champion connects chat (Slack or Microsoft Teams) + GitHub App.
- Employees mapped into the eng pod (not whole company).
- Graph builds quietly (shadow — rare/no spam).
- Champion cockpit: map, conflicts, pulse, heat, digests.
- ICs: private digests with Approve / Edit / Don't send.
- Optional tomorrow focus from open work + blockers (human-gated).

2. Phases

Phase 0 — Join

Invite → Google/SSO → tenant seat → role (champion vs member). Optional chat identity link. *Today: white-glove map; full SSO not productized.*

Phase 1 — Connect

- Connect chat: Slack or Teams (one primary delivery plane per tenant).
- Connect GitHub: App install once on org/repos.
- Map the pod (doc 04) — auto-suggest + confirm, or manual.
- Continuous ingest → graph. Quiet period = shadow learning, not a bug.

Phase 2 — Quiet learning

Graph fills; digests compile under Notify Policy; champion watches cockpit; ICs may see little yet.

Phase 3 — Champion cockpit

Panel	Content
Team map	Mapped people; click → graph neighborhood
Conflicts	Dual owners, SHIP vs FREEZE, BLOCKED on shared work
Team pulse	Open work / empty window / blockers today
Heat	Team activity first; no individual rank table
Digests board	Last draft per person → Approve / Edit / Don't send
Tomorrow focus	Suggestions from open PRs + blockers; human assigns

Phase 4 — IC day-to-day

Private digest on Slack DM or Teams chat when story **changes**. Same three actions. Optional web My status.

Phase 5 — Outcome

Cancel standup if trusted; grow map 2→10; scorecard: suppressions, Don't-send rate, empty windows.

3. Polish rules (never sell)

Never	Instead
LOC / efficiency leaderboards	Team heat + work context + conflicts
Personality “conflict scores”	Conflicts on shared work items
Agent auto-assigns tasks	Human-gated tomorrow focus
Google = eng data plane	Google = who; GitHub = ship; chat = deliver
Whole-company chat index	Only mapped eng pod digests

4. Live today vs build next

Capability	Demoable now	Vision
Slack digests + Approve	Yes	Same
Graph people/PR/intents	Yes	Champion packaging
Dual digests	Yes (pilot)	Self-serve 10-seat
Teams digests	No	Adapter + Adaptive Cards
Connect Slack/GH buttons	Partial/manual	Real install UX
Google/SSO join	No	Multi-tenant packaging
Manual map	Yes	Forever fallback
Tomorrow focus board	No	Later scoped feature

5. Sales language

“Your eng pod signs in with company identity. You connect Slack or Teams, install the GitHub App once, and pick who is on the map. We build a permissioned graph while staying quiet. Then each engineer gets a rare private status draft they control—and you get a cockpit so the standup can die.”

If they ask “is that live?” → show pilot path in doc 01; this doc is the product destination.

6. Product slate (critical only)

- Champion cockpit packaging (existing APIs)
- Finish Connect Slack + Connect GitHub
- Delivery abstraction + Teams bot (same actions)
- Mapping UX: bulk + auto-suggest
- Google/SSO + roles; tomorrow focus board
- Other chat only after Slack+Teams proven

Out of scope: Linear day-one, model training, productivity rankings, silent 1:1 wiretap.
