

Auth, Onboarding & Chat Delivery

Google · Slack · Teams · GitHub · multi-chat horizon

Pitch: Status that writes itself from your PRs and pushes — you approve before anyone sees it.

1. Three planes (keep separate)

Plane	What it is	Examples
Identity	Who is on the tenant	Google/SSO, invites, roles
Work ingest	What engineers ship	GitHub App (PRs, commits, pushes)
Delivery	Where digests land	Slack bot · Teams bot · later chat

Google does **not** replace GitHub. Chat does **not** replace the graph.

2. Adapter architecture

GitHub ingest → events → graph → digests → **Notify Policy v1** → delivery adapter → Slack (live) / Teams (roadmap) / future chat.

- Same actions on every channel: Approve · Edit · Don't send
- Bot tokens only in egress vault
- Never silent-read private human↔human messages

3. Chat options

Slack — primary today

Bot DMs mapped users. Map GitHub identity → Slack user id. **Demoable** on staging.

Microsoft Teams — roadmap (same product)

“If you're on Teams, same loop—connect Teams instead of Slack. Digests in Teams; Approve / Edit / Don't send.”

Item	Detail
App	Azure Bot + Teams app manifest
Identity	Azure AD user / UPN
Map	GitHub → Teams/AAD id
UI	Adaptive Cards for actions
Status	Not live on staging yet
Order	After Slack airtight; shared delivery interface

Horizon (only if asked)

Channel	Stance
WhatsApp Business / other enterprise chat	Adapter architecture later; prove Slack+Teams first

Channel	Stance
Email	Emergency fallback only — not primary eng status

Do **not** promise WhatsApp dates on first calls.

4. What Connect grants

Connect...	Grants	Does not grant
Slack / Teams	Message mapped users; resolve chat ids	Surveillance of private 1:1 history; full chat search
GitHub App	Events for installed repos	Unrelated orgs; replace code review tools
Google / SSO	Tenant membership + roles	Eng graph data by itself

5. Onboarding options

Option 1 — Manual (live now)

Paste chat user ids + GitHub logins; webhook + bot in vault. Works today; 45–90 min. **Sales:** white-glove pilot.

Option 2 — Connect Slack or Teams + Connect GitHub

Install buttons; auto identities. Medium effort (Slack polish first; Teams next). Best “product feel.”

Option 3 — Google/SSO + connectors

Company login for seats; then chat + GitHub. Medium–high with multi-tenant packaging.

6. Recommended sequence

- Manual map — always keep
- Connect Slack + Connect GitHub
- Connect Teams (parity adapter)
- Google/SSO for invites + roles
- Other chat only after Slack+Teams stable

“We white-glove connect your chat (Slack or Teams) and GitHub and map your eng pod. Roadmap is Connect buttons so the champion doesn’t paste IDs forever.”

7. Multi-chat cheat sheet

They say	You say
We're on Slack	Perfect—that's live for pilots.
We're on Teams	Same product design; Teams delivery on roadmap with same Approve loop.
We need WhatsApp	Adapter model supports more channels later; prove Slack+Teams first.
Read all our Teams history?	No. We deliver digests and resolve identity—we don't wiretap private chats.
