

Employee Mapping Playbook

Sales Q&A · Paths A–D · Start with 2, grow to 10

Pitch: Status that writes itself from your PRs and pushes — you approve before anyone sees it.

The question

How does each employee get onto AI Manager?

Every path ends with the same objects: person twin · GitHub aliases · chat user id (Slack or Teams) · ACL groups. Only **mapped** people get digests. Unmapped = no spam.

Rule of thumb for 10 people

- Start with 2 airtight digests (champion + one IC).
- Expand to the rest of eng when Don't-send rate is healthy.
- Never map whole company chat (Sales, HR) on day one.

Path A — Champion maps roster (manual) · Live today

List name + GitHub login + Slack/Teams id → Team UI. After GitHub activity, digests compile.

“Fastest pilot: we map your 10 with you in one install call.”

Path B — Connect chat → auto-suggest · Vision

Connect Slack or Teams → pull members → champion ticks eng pod → match GitHub collabs; flag unmatched.

“Connect chat once; you choose who gets digests—no spam to all of Sales.”

Path C — Employee self-map (invite) · Vision

Invite link → SSO or Sign in with Slack/Teams → employee links GitHub → lands as member; champion can disable.

“Each person can join via invite and link GitHub—champion still controls the pod.”

Path D — GitHub-first · Partial / vision

GitHub App sees collaborators / recent authors → suggest who ships → attach chat id second.

“We can start from who's already shipping in the repo.”

Comparison

Path	Best for	Status
A Manual	Design partner, speed, control	Live
B Auto-suggest	Mid-size pods, less pasting	Roadmap
C Self-invite	Self-serve feel, distributed teams	Roadmap

Path	Best for	Status
D GitHub-first	Repo-centric teams	Partial / roadmap

All four can coexist. **A never goes away.**

Scripted answers

They ask	You answer
Website account for everyone?	Not required. ICs are chat-first. Mapping links GitHub + chat.
Paste 10 Slack IDs?	Pilot often yes (A)—fast. Product path is Connect + tick roster (B) or invite (C).
Someone not mapped?	No digest, no spam. Expand when ready.
Whole Slack workspace?	You select the eng pod only.
Teams users?	Same model: GitHub ↔ Teams/AAD id (adapter roadmap).
How long for 10?	2 people in first install call; rest over learning window.

Install quality checklist

- ≥2 people with chat id + GitHub alias
- Multi-person ready
- Each has recent work or honest empty window (no fake DM)
- Graph shows real people (not demo theater as the story)
- Compile: with_items when work exists

Close

“Mapping is how we stay permissioned and spam-free: only the eng pod you choose gets digests. Start with two, prove trust, then bring the other eight.”
